

Week 8

Neha Parmar

In Week 8, I am following my XP value feedback to carry out project tasks. My team is working on integrating and we are on the verge of finalizing the project.

Also, bug free execution of code needs that we run all the required test cases for our project. There will be unidentified scenarios which will go unnoticed. Our team is focusing on having a complete set of test cases to run against. We want to be sure that our projects runs uninterrupted at the final demo day.

Our project journey is about to come to end. Presenting for extra credit is also in our list. We want to show our project demo to people not from Computers/Software background and make them understand how our project is working. The main idea behind this is the ultimate vision of this project.

The pattern I picked for restricting inconsistent states previously was Singleton. Now I am going to use Factory Pattern to give structure to our application to create all the instances in one common file.

We had several rounds of discussions, and what we have learn is – Communication is really important for successful execution of a project. Being able to sort all the impediments and issues is the main reason to have efficient peer communication. My team has been really responsive when talking about problems, reaching out to help other team members, and coming up with new suggesting to address use cases in innovative ways.

We look forward to complete the many aspects of our project and be able to demonstrate full capability on the final day.
